

STATEMENT OF PURPOSE

RoadSoS_AI — Infinity Hacks 2026 | Road Safety Track

Every six minutes, someone in India dies waiting for help that never arrives in time. Sixty seconds is the difference we are here to build. Over 1.5 lakh lives are lost every year on our roads — the highest toll in the world — and nearly half of these deaths are preventable. The tragedy is rarely the crash itself; it is the silence that follows it: a phone that cannot be reached, a responder who does not know what the victim is allergic to, a location shared five minutes too late. We built RoadSoS_AI because we refused to accept that this silence was inevitable.

The Problem We Refuse to Ignore

India's average emergency response time exceeds six minutes — in the Golden Hour that follows a crash, every one of those seconds decides who survives. Yet every existing safety system rests on one fatal assumption: that the victim is conscious enough to ask for help. That assumption breaks at the exact moment it matters most. No automatic detection. No shared medical context. No guidance in the gap between impact and arrival. RoadSoS_AI exists to close that gap, permanently.

Our Solution

RoadSoS_AI is an AI-powered, real-time emergency response system engineered to act even when the victim cannot — unconscious, trapped, or alone. Three independent triggers guarantee no single point of failure: accelerometer and gyroscope sensor fusion for automatic crash detection, a shake gesture for instant manual distress signaling, and hands-free voice activation that works even when the phone is locked. The moment any trigger fires, live GPS location streams via SMS, WhatsApp, and direct calls to emergency contacts and services, while the victim's medical profile — blood group, allergies, existing conditions — reaches responders before they arrive. An AI-powered first-aid assistant then guides whoever is on scene through the critical minutes that follow. The system runs silently in the background even when the app is closed, and its core emergency functions work fully offline — because protection that depends on network coverage is not protection at all.

Why It Matters

Our mission is singular and measurable: cut emergency response time from over six minutes to under sixty seconds. This is a direct answer to the Road Safety Track's core challenges — real-time sensor fusion for accident prediction, a triple-trigger AI co-pilot for driver assistance, and an architecture built to extend into live traffic-aware emergency routing. We are not adding a feature to the dashboard. We are rebuilding what happens in the sixty seconds after a crash, when it matters more than at any other point in the journey.

Our Commitment

We are Harsh Parmar, Kakshil Adeshara, and Aum Joshi — a team united by one conviction: technology's highest purpose is protecting the people who depend on it. We have built RoadSoS_AI as a system we would trust with our own families' lives, not as a weekend build to be judged and forgotten. We are here to prove that a smarter sixty seconds can outweigh six minutes of silence — and we intend to leave no doubt about it.
